Class Problem 19: Class Enrollment

- Create a **class** "`Course`" that has

  – A "`students`" attribute, initialized as empty list

  – A constructor `__init__` that gets a name as argument and sets the "`name`" attribute of the class accordingly

  – A method "`enroll`" with an argument that will be added to the list of students for the course

```
class Course:
    ...
cs5p = Course("Introduction to Python")
print(cs5p.name) # Introduction to Python
cs5p.enroll("Jane Smith")
print(cs5p.students) # ["Jane Smith"]
```

- Finally, submit the file to Canvas
